

Meet Avery.

One fitness club. Three apps.

Avery is a fictional club member who shares an interest in evening yoga.

FICTIONAL CLUB MEMBER

Avery Example

INTEREST

Evening yoga · after 6 pm

KEEP

Paid Saturday strength class

Club Portal

Membership & interests

Avery fills in a fitness questionnaire and agrees to share it.

Class Booking

Bookings & recommendations

Uses shared interests to suggest yoga.
Also holds a paid Saturday class.

Member Offers

Personalized promotions

Uses shared interests to prepare a yoga invitation.

Avery consents once. Their interests create saved information in all three apps.

Avery changes their mind. The other apps still remember.

Recall is a separate privacy dashboard for withdrawing consent across these connected apps.

1 · INVESTIGATE

Find the linked copies

Discover records, trace their origins, inspect their state.

2 · APPROVE

Review the exact scope

The member approves removal; the paid booking stays.

3 · VERIFY

Check the actual result

Remove approved copies and issue a verification receipt.

Remove the shared interests, recommendation and invitation. Keep the paid booking.

Stop personalization. Keep the membership working.

Withdrawing consent should change how interests are used without erasing the whole account.

REMOVE

Shared interests & copies

The yoga preferences, recommendation, audience label and invitation.

PRESERVE

The services Avery still wants

Paid Saturday class, membership contact card and public class listings.

PREVENT REUSE

Keep withdrawn copies out

Block the removed record IDs from returning through an old import.

Success means removing the right information—and proving the useful parts still work.

Three agents. A separate judge. LangGraph coordinates the work.

Distinct model roles, sequential handoffs, and a human approval boundary.

A plan is not permission. Every write must match the member's approved scope.

RECALL

THE DEMONSTRATED RESULT

Copies removed. Paid booking preserved.

The same Avery story, checked before, after, and on replay.

1 · BEFORE

Copies survive source deletion

The yoga recommendation and invitation remain.

2 · AFTER APPROVAL

7 targets verified absent

Includes the source deleted earlier.
The paid Saturday booking remains confirmed.

3 · REPLAY

Old import is blocked

The withdrawn preference record cannot return through the tested replay path.

A privacy choice becomes a visible change across apps, with a receipt.

Demonstrated on synthetic local stores. Other sectors require new integrations; this is not universal external-data deletion.
